A Quick-acting Ring Counter

**PERIODICAL:**

Priborostroyeniye, 1959, Nr 8, pp 11-15 (USSR)

**ABSTRACT:**

Among the possible schemes for the discrete counting of pulses the ring counters are of great interest, and figure 1 shows a principle scheme of such a ring counter. The inclination to malfunction of this scheme is pointed out, and it is found that by an increase of the number of tubes a decrease of the potential differences at the grids of the tubes occurs. In this way ring counters with more than six steps become very uncertain. In trigger-ring-counters this phenomenon does not occur with an increase of the number of tubes; such a trigger-ring-counter is shown by figure 2. In these schemes the grids are adjacent to voltage dividers and the grid voltage is independent of the number of steps. Figure 4 shows the voltage variations at the anodes and the grids of the tubes after which the system of equations (1) for the calculation of the scheme at static operation is given. As the circuit under investigation is one with double triodes, the second trigger serves as a basis and the

Card 1/2

. A Quick-acting Ring Counter

SOV/119-59-8-4/15

case is investigated in which the left side of this trigger is open and the right is closed. For this case the anode voltages are given by the equations (4) and (5). For the analogous reversed case the anode voltages are given by the equations (6) and (7). Next, the grid voltages are derived: equations (8) and (11). The two conditions for the exact operation of the scheme are then given: The inequalities (12) and (13). From the formulas thus obtained formula (15) is finally developed for the grid voltage of the right side and the inequality (16) is given. The voltage difference at the grids is calculated by means of formula (17). In the last part of the present paper the permissible error limits of the elements used in this circuit are evaluated, and formulas (27) and (28) are developed for the determination of the permissible error limits. In conclusion, calculation of an example is carried out. There are 4 figures and 3 references, 2 of which are Soviet.

Title : Tritium as a Tool in Industrial and Chemical Research

Orig Pub : Sb. Primeneniye radioaktivnykh izotopov v prom-sti,  
meditsine i s. kh. [Symposium on the Application of  
Radioactive Isotopes in Industry, Medicine, and Agri-  
culture], Izd-vo AN SSSR, Moscow, 1956, 94-112

Abstract : Tritium has a number of advantages over D and  $C^{14}$  as a  
tracer: a higher activity, ease of introduction into  
molecules, low cost. Its drawback consists in the radi-  
oactive decomposition of tritium-tagged compounds. For  
purposes of analysis the compounds containing T are con-  
verted to a mixture of  $CH_4$  and  $H_2$ , the activity of which  
is measured in an ionization chamber. The tritium-tagged

Card 1/2

compounds are prepared by reduction with the hydrides of Li-B, Li-Al, and Na-B, which contain T. Another method consists in the neutron irradiation of the respective compounds in the presence of the lithium salt. The tritium formed by the  $\text{Li}^6(n, \alpha)$  reaction enters the organic molecules. Data are presented on the activating effect of various groups, maximum specific activities, etc. Tritium-tagged methyl groups were used in the methylation of hydrocarbons for the purpose of investigating their structure. A series of data are presented on the fractionation of the T and H isotopes by partition chromatography and on the effect of the isotope composition of hydrogen on the rate of some reactions.

In the experiments described a conical indentation was produced by pressure on a specimen of hardened and tempered steel having a fine grained and homogeneous structure. The diameter of the base of the indentation was 4mm. and the hardness of the area round this was determined with a Vickers hardness tester after mechanical and electrolytic polishing. The indentations were distributed radially round the edge of the hole at 1 mm intervals and the results are presented in the form of lines of equal hardness. Similar tests were carried out on compressed specimens and the results of these are presented in the same way and in relation to the deformation.</p>

TITLE: Determination of the Impact Hardness and of the Constants of Steel (Opredeleniye udarnoy tverdosti i postoyannykh stali)  
PERIODICAL: Fizika Metallov i Metallovedeniye, 1958, Vol 6, Nr 3, pp 534-539 (USSR)  
ABSTRACT: In the case of determination of the hardness by static methods there is the following dependence between the indentation force  $P$  and the diameter of the indentation  $d$ :  $P = ad^n$ , where  $a$  and  $n$  are constants of the metal of which  $a$  depends on the diameter of the ball, whilst  $n$  does not depend on the ball diameter and varies between 2 and 2.5. According to Klass, (Ref 2) and Edwards and Willis (Ref 3), the exponential relation is also valid for the case of impact indentation of a ball but the numerical value of  $n$  is considerably smaller during impact. Shevandin (Ref 4) found that the value of  $n$  remained practically unchanged for steel and copper on reducing the temperature to between +100 and -196°C and concluded that there is no reason to anticipate a reduction in the value of  $n$  in the case of impact since

Card 1/4

SOV/126-6-3-21/32

Determination of the Impact Hardness and of the Constants of Steel

a reduction in the temperature has the same influence on the properties of steel as an increase in the speed. Also he stated that Klass, Edwards and Willis failed to take into consideration the elastic energy of the specimen and the ramming effect. The aim of the work described in this paper was to measure the impact hardness of carbon steels under varying conditions, to determine the constants  $a$  and  $n$  and to establish the influence of carbon in the steel on the dynamic coefficient. Six grades of carbon steel were investigated on specimens of circular cross section in the annealed state with carbon contents of 0.17, 0.22, 0.47, 0.63, 1.06 and 1.16%. The impact indentation was effected with a ball and with a cone with an angle of  $90^\circ$  at the apex, using a ballistic impact testing machine; the maximum force of impact and the work of the plastic deformation were measured simultaneously. On the basis of the obtained results the following conclusions are arrived at:

1. The energy loss during impact caused by the elastic deformation of the pendulum elements is in the first approximation proportional to the impact force, which

Card 2/4

SOV/126-6-3-21/32

Determination of the Impact Hardness and of the Constants of Steel

apparently is valid for all pendulum impact testing machines;

2. The power index in the Meyer law in the case of impact indentation of a sphere changes little compared to the case of static indentation;

3. The dynamic coefficients depend on the carbon content of the steel and it will be lowest for medium carbon contents;

4. The main source of errors in determining the static strength by means of impact instruments is the dependence of the dynamic coefficient on the carbon content of the steel;

5. It is possible to design a vertical hammer for determining the impact hardness under shop conditions.

The force of impact of the indentation of a sphere into the investigated metal can be determined by means of an elastic element and an instrument containing such an element can be used for determining the impact hardness of metals at elevated temperatures with a satisfactory

Card 3/4 accuracy. The obtained hardness value will characterise

Determination of the Impact Hardness and of the Constants of Steel

SOV/126-6-3-21/32

the resistance of the material to plastic deformation without distortions due to recrystallisation and thus values will be obtained which are important for hot shaping of metals.

There are 4 figures, 2 tables and 11 references, 9 of which are Soviet, 2 German.

TITLE: The Influence of Bending in Tests of Torsional Strength  
(O vliyanii perekosa pri ispytanii na krucheniye)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol. 24, Nr 6, pp. 764 - 767  
(USSR)

ABSTRACT: A bending of the sample in torsional strength tests can occur by the non-coincidence of the axes of revolution of the active and passive holding device as well as by a displacement of the disks between axes of the holding devices with respect to the axis of revolution; in this connection those cases are of interest in which the amount of bending does not depend on the angle of rotation of the sample. If the axis of the sample coincides with the axis of rotation the torsional moment along the sample is constant, if not it changes according to the length of the sample. In solving the problem of the bending of the sample, an expression can be obtained for the calculation of the reactive forces  $R$  and  $m$  as functions of the parameters  $\alpha$  and  $\delta$  characterizing bend-

Card 1/3

The Influence of Bending in Tests of Torsional Strength

32-24-6-33/44

ing ( $\alpha$  = angle of rotation of the axis of rotation of the holding device, or the angle characterizing the rotation of the disks between the axes of the holding devices with respect to the axis of rotation;  $\delta$  = the displacement of the axes of rotation of the holding devices with respect to each other, or the displacement of the disks between the axes of the holding devices). Mathematical derivations as well as graphical representations and a table for various characteristics of the bending are given. The measuring technique shows among other things that the samples were tested on MK-25 machines (built by the Rostov/Don Institute of Railroad-Transport Engineers) with ordinary holding devices as well as with holding devices which had a hinge of the Guk type, and that thus bending of the sample was prevented. In order to be able to classify the magnitudes of the bending of the sample in ordinary holding devices a special method was worked out by using a Gugenberg tensometer. The experimental results obtained showed that the possible bending in torsional tests may lead to remarkable errors in some cases; this can be reduced considerably in the machines mentioned by an alteration of the above mentioned hinges. There are:

AUTHOR: Vandyshev, N.P.

TITLE: The broaching of a small inside hexagon on an automobile lathe

PERIODICAL: Avtomobil'naya promyshlennost', no. 6, 1960, 35-36

TEXT: The author briefly describes the old process of machining a stop screw of a heavy load regulator and of broaching into it an inside hexagon, reports on a combined method with the help of a 1118-type automatic lathe; and describes and illustrates a new technological process of broaching, carried out on the above lathe. The new technological method permits one to eliminate the manual operation of broaching and to reduce the machining time 3 times. To carry out broaching by the combined method (Fig. 2) with a 1118-type automatic lathe, a special holder had to be made. Rotary holder of the die 2 is fastened in the holder by two nuts 3 and by disc 4. Die 5 is made from 47A (UTA) steel with a hardness of RC 50-55 and is placed in the opening of the holder and tightened with screw 6. Thrust bearing 7 and the bronze bush 8 allow the die holder to rotate while

TITLE : Ascochyta Infection of Alfalfa and Control.

ORIG. PC9.: Zap. Voronezhsk. s.-kh. in-ta, 1957,  
27, No.2, 319-325

ABSTRACT : Two types of Ascochyta infections are described, caused by different agents. Ascochyta imperfecta produces dark spots; light colored spots appear as the result of the action of A. sp., and not A.pisi, as has been believed previously. A.sp. does not cause infection in peas and is distinguished from A.pisi by morphological and cultural characteristics. Prophylactic and agrotechnical control measures are recommended.--N.G. Dzholova

TITLE:

Study of conditions for producing polyisobutylene from  
Grozny crude oil

PERIODICAL:

Referativnyy zhurnal. Khimiya, no. 22, 1961, 397, abstract  
22M123 (Tr. Groznensk. nef. in-t, v. 3, no. 25, 1961,  
35 - 46)

TEXT: The authors give results of laboratory tests for producing poly-  
isobutylene (I) of molecular weight 3500 - 13,800 usable as a condensing  
additive for lubricants. The tests were conducted on the desulfurized  
fraction (DF) with boiling point -7 to +4.5°C produced by rectification  
and desulfurization (passing through solid KOH) from the works butane-  
butylene fraction in 87% by weight yield. The DF contained (% by weight):  
0.3 C<sub>3</sub> hydrocarbons; 16.1 iso-C<sub>4</sub>H<sub>8</sub>; 25.5 n-C<sub>4</sub>H<sub>8</sub>; 57.7 C<sub>4</sub>H<sub>10</sub>, and 0.4  
hydrocarbons C<sub>5</sub> +. Polymerization tests were conducted at -15 to -50°C

Card 1/2

during 2 - 5 hr in the presence of an  $AlCl_3$  catalyst. The polymerization product was treated with alcohol to decompose the  $AlCl_3$ . The light components with boiling points up to  $100 - 110^\circ C/10$  mm Hg were distilled off. The samples of I obtained corresponded to the tentative technical specifications. The highest yield of I (12.9% by weight of DF, or 84% of iso- $C_4H_8$ ) was obtained by 3 hr polymerization at  $-15^\circ C$ . No depolymerization of I occurred when 5% solutions of I in "J" ("L") turbine oil were heated at  $200^\circ C$  for 5 hr. The solutions retained their viscosity. Title : The Effect of Intracerebrally Injected Streptolysin O.

Orig Pub. : Casop. lekaru ceskych, 1957, 96, No. 27-28, 894--896.

Abstract : When Streptolysin O was injected intramuscularly into cats, no changes in their behavior were noted. When 0.1--0.5 ml of it was injected into the ventricular system through a trephined orifice, within 3 to 4 minutes the first signs of its action were noted--mewing at regular intervals, licking and profuse salivation. Pronounced nystagmus was seen among some of the animals. Subsequently there was a change in the activity of the motor apparatus: the muscular tonus of the extensors of the anterior extremities and the muscles of the head was seen
